Discussion

# Two questions

Take a sample of articles published 10 years ago. Two questions:

- 1 How many of the methods proposed in methodological papers have been actually **applied** in substantive analyses?
- 2 How many of the results published in the substantive papers could be exactly **reproduced** (if you had the data?)

# Two questions

Take a sample of articles published 10 years ago. Two questions:

- 1 How many of the methods proposed in methodological papers have been actually **applied** in substantive analyses?
- 2 How many of the results published in the substantive papers could be exactly **reproduced** (if you had the data?)

# Two questions

Take a sample of articles published 10 years ago. Two questions:

- 1 How many of the methods proposed in methodological papers have been actually **applied** in substantive analyses?
- 2 How many of the results published in the substantive papers could be exactly **reproduced** (if you had the data?)

# Some answers

In both questions, the **software implementation** of the statistical methods is likely to play an important part

The application of statistical methodologies also depends on how well/much the software is **documented** and **user-friendly**

The reproducibility of results depends instead on availability of **details** on the statistical methods and (possibly) **scripts** of the analysis

# Reproducible research

An approach to research which ensures that all the steps of a study, results included, can be exactly repeated

A concept related to how much some research is **accessible**

In the context of statistical analysis, this translates in the **software**, **code** and **original data** to be available to the research community

## Discussion

# The model

For  $k$  outcomes  $\hat{y}_i$  estimated in in each study  $i$ :

$$\hat{y}_i \sim N(\mathbf{X}_i\boldsymbol{\beta}, \mathbf{S}_i + \boldsymbol{\Psi})$$

with  $\mathbf{S}_i$  and  $\boldsymbol{\Psi}$  as **within** and **between** (co)variance matrices

Alternately, as a linear mixed-effects (LME) model:

$$\hat{y}_i = \mathbf{X}_i\boldsymbol{\beta} + \mathbf{b}_i + \epsilon_i$$

with between-study random effects  $\mathbf{b}_i \sim N(\mathbf{0}, \boldsymbol{\Psi})$  and  
within-study errors  $\epsilon_i \sim N(\mathbf{0}, \mathbf{S}_i)$

## Discussion

**Several estimators** available: fixed, ML and REML,  
method of moments

Likelihood-based models can be fitted in **SAS** using the  
procedures for LME models

Ian White has developed the command mvmeta in **Stata**

# The package mvmeta

Multivariate meta-analytical models implemented in the **R package mvmeta**, available in the R CRAN currently with version 0.3.5

Main functions:

- `mvmeta()`
- `predict()` and `blup()`
- `qtest()`
- `mvmetaSim()` and `simulate()`

See `example0.R`

# Documentation

The documentation of a package consists of **help pages** for each function and optionally for the package, plus optionally package **vignettes**

The documentation, as mentioned earlier, plays a key role in usability of the package

In particular, the different sources of documentation should be **structured** accordingly with the different level of complexity

See `example1.R`

# Full or profiled likelihood

The importance of  
computing in  
statistical analysis

Gasparrini A

Defining  $\Sigma_i = \mathbf{S}_i + \Psi$ , the restricted log-likelihood  $\ell_R$  is:

$$\ell_R = -\frac{1}{2} (n - q) \log \pi - \frac{1}{2} \sum_{i=1}^m \log |\Sigma_i| - \frac{1}{2} \log \left| \sum_{i=1}^m \mathbf{x}_i^T \Sigma_i^{-1} \mathbf{x}_i \right| + \\ - \frac{1}{2} \sum_{i=1}^m \left[ \left( \hat{\boldsymbol{\theta}}_i - \mathbf{x}_i \hat{\boldsymbol{\beta}} \right)^T \Sigma_i^{-1} \left( \hat{\boldsymbol{\theta}}_i - \mathbf{x}_i \hat{\boldsymbol{\beta}} \right) \right]$$

Given  $\hat{\Sigma}_i$ :

$$\hat{\boldsymbol{\beta}}(\hat{\Sigma}_i) = \left( \sum_{i=1}^m \mathbf{x}_i^T \hat{\Sigma}_i^{-1} \mathbf{x}_i \right)^{-1} \sum_{i=1}^m \mathbf{x}_i^T \hat{\Sigma}_i^{-1} \hat{\boldsymbol{\theta}}_i , \\ V \left[ \hat{\boldsymbol{\beta}}(\hat{\Sigma}_i) \right] = \left( \sum_{i=1}^m \mathbf{x}_i^T \hat{\Sigma}_i^{-1} \mathbf{x}_i \right)^{-1} .$$

# The importance of computing

Nowadays, computing plays an essential role in statistical analysis

Beside obvious advantages, this also presents some problems about reproducibility

Also, the use of more complex computational techniques requires an expertise beyond the usual statistical skills

# Software implementation

The importance of  
computing in  
statistical analysis

Gasparini A

The implementation of statistical techniques in a software provides several benefits

However, software development takes time and efforts, and should be carefully planned

Documentation is essential to improve the usability of the software

Software and computing in general should be considered an inherent part of any statistical research
